

ruTorrent - Limiting seeding ratio

This short guide will show you how to limit the seeding ratio in Deluge, so you can comply with our restrictions on public tracker seeding.

Ratio Groups

- Start off by opening up your settings in rutorrent and clicking the **Ratio Groups** option.
- Fill out the top one (or any other one if you wish) with the following settings and give it a name
 - The setting given will stop the torrent from seeding over 2 ratio.
 - You can choose any action to the torrent after it has reached that requirement.
 - We recommend **Stop** as the action. This is for you to download the files to your PC
 - You can also select **Remove** to remove the torrent or **Remove data** to remove the torrent and its associated files

Min %	Max %	UL,MB	Time,h	Action
200	200	any value	-1	Stop

- To apply this to torrents
 - Right click on the torrent you want to limit
 - Select **Select ratio group** and click your newly created ratio group
- You can also set this to be done by default to all future torrents by using the **Default ratio group** option in the bottom right of the ratio groups screen
 - Select the number corresponding to the created ratio group. In this case, select 1 and click OK.
 - Please note that setting this will restrict every torrent, private or public, in ruTorrent to a 2 ratio.

Using ExtRatio Plugin to automatically set ratio groups

You can also use ExtRatio to automatically filter and set future torrents to a certain ratio group or throttle group.

- Install the plugin by running the following command

```
cd ~/www/rutorrent/plugins/ && svn checkout https://github.com/Novik
/rutorrent/trunk/plugins/extratio && svn checkout https://github.com/Novik
/rutorrent/trunk/plugins/throttle && cd ~
```

- Then access ruTorrent interface and go to Plugins Ratio Rules
- Here, we want to set all future public torrents to be set to the created ratio group earlier.
 - Click Add and set a name
 - On the If box, select **All torrent's trackers are public** from the dropbox
 - Then on Then box, select the public group created.
 - In this case, it's named Publics.
 - Confirm the changes by clicking OK.
- When set, all future torrents from popular public trackers will be set to Publics ratio.
- Should there be public torrents that are not throttled, it may be due to it not being included to ruTorrent's Public Tracker list.
 - You may have to manually add the tracker url by selecting **One of torrent tracker's URLs contains** from the Ff dropbox then input the public tracker's hostname.
- You can also set the following in the If dropbox, according to your needs
 - Torrent label contains
 - One of torrent tracker's URLs contains
 - All torrent's trackers are public
 - One of torrent tracker's URLs contains
 - One of torrent trackers is private
